

winner take all axis takeaways

takeaways:

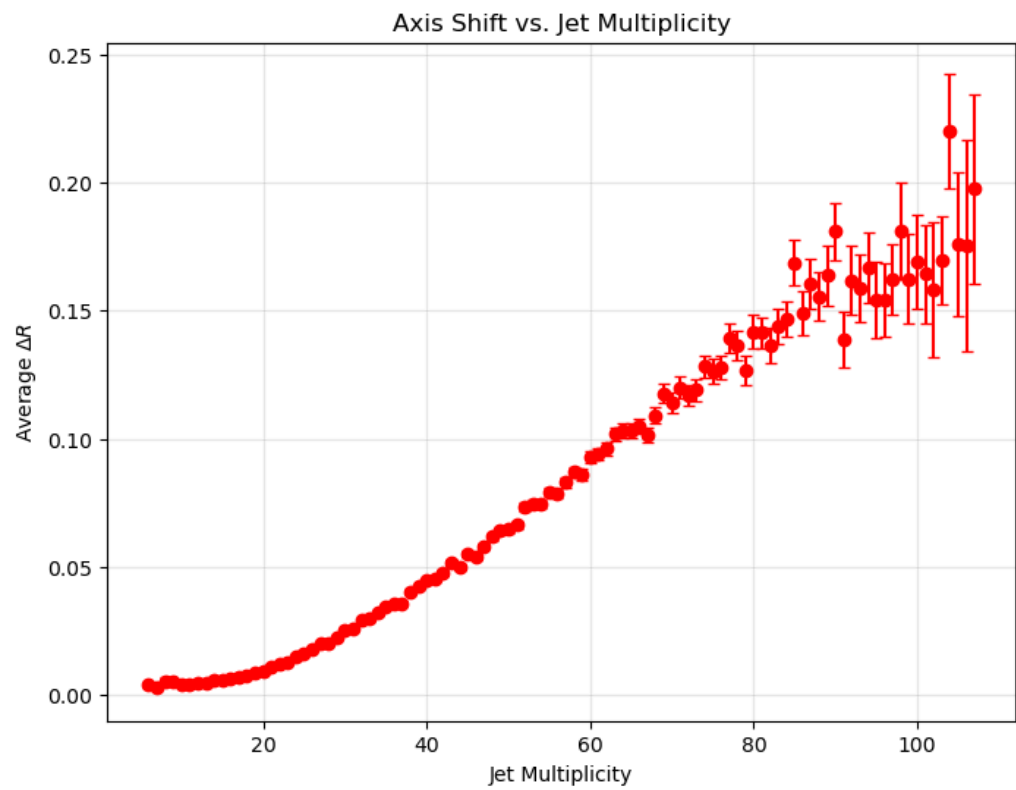

- 1. most jets have very little angular separation between standard and wta axes

- 2. the axis shift is pretty much symmetric in $\Delta\eta$ and $\Delta\phi$

3. HOWEVER axis shift is higher for higher multiplicity jets

4. the ratio of WTA pt to standard pt also increases with multiplicity (but this is a quirk of how WTA is defined; it is to be expected by triangle inequality since wta pt is a scalar sum and standard pt is a vector sum)
